 VocaC

small tools. clear boundaries.

Voca is a family of speech-to-text tools for machines you already own. Hold a hotkey or tap the phone control. Text lands where you type. The boundary stays visible.

01

On-device first.

After the model download, audio and the speech-to-text model stay on the phone or computer.

02

Free and open source.

The actual license is named per project. Usually AGPL-3.0. VocaWin is AGPL-3.0-or-later.

03

Text lands where you type.

Hold a hotkey or tap the phone control. Words appear at the cursor when the platform allows it.

04

No required account.

There is no Voca login. No hosted speech cloud to sign up for.

05

Honest status.

Available, beta, alpha, early. We say what ships, and we do not invent a screenshot.

06

Built in public.

Source and releases live on github.com/VocaHQ. Status follows PRODUCT.md.

PATH / A · ON THIS DEVICE

on this device.

After the model download, audio and the speech-to-text model stay on the phone or computer.

Download and update still use the network. Do not call this offline in the absolute sense.

A gateway is not required for this path.

A · audio stays on the machine you spoke into

PATH / B · YOUR VOCAGATEWAY

or your gateway.

Configured audio leaves the client for the self-hosted machine you selected.

Trusted LAN, encrypted private network, or HTTPS. The gateway runs a local speech engine and returns the transcript.

Never call this on-device. VocaGateway is optional shared compute, not a client.

B · audio travels to hardware you host · never on-device

VocaLinux

vocalinux

System-wide voice typing for real Linux desktops.

ver v0.16.0**os** X11 + Wayland**engine** whisper.cpp, Whisper, or VOSK**lic** AGPL-3.0

[/vocalinux](https://github.com/VocaHQ/vocalinux)

One install on a real desktop. X11 and Wayland. The family name is VocaLinux.

VocaMac

vocamac

Hold a hotkey, speak, and text appears at the cursor.

ver v0.9.0**os** macOS 14+ Apple Silicon**get** Homebrew or DMG**engine** WhisperKit**lic** AGPL-3.0

VocaPhone

vocaphone

A private voice keyboard for phones.

android 13+ public beta

ios 17+ source build

gateway optional

lic AGPL-3.0

Tap the control. Speak. Text lands in the app you already have open.

Android is the public beta. iOS is a source build.
Gateway is optional and is never on-device.

voice typing that stays on this PC.

status unsigned NSIS/MSI

rel v0.1.0-beta.1

store not a listing

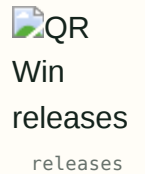

lic AGPL-3.0-or-later

unsigned beta · no screenshot

Unsigned. Windows will likely say the publisher is unknown.

Installer is on GitHub Releases (v0.1.0-beta.1, prerelease, unsigned). SmartScreen is expected. This is not a Store listing. This catalog does not invent a VocaWin screenshot.

audio stays on this PC. after
the model download.

VocaGateway

vocagateway

Self-hosted shared compute for Voca clients. Pair with a QR code.

host macOS / Linux / Docker Compose

role optional · never on-device

lic AGPL-3.0

VocaGateway
1U host mark

NEVER ON-DEVICE

When you configure it, audio leaves the client and travels to the machine you host. Trusted LAN, encrypted private network, or HTTPS.

Infrastructure, not a client. Optional shared compute. This path is never on-device.
